1. FOREWORD.

The contents of this manual are considered to be proprietary and confidential to FISCHBEIN and should not be reproduced without the prior written permission of FISCHBEIN.

Nothing contained in this document is intended to extend any promise, warranty or representation, expressed or implied, regarding the FISCHBEIN products described herein.

Any such warranties or other terms and conditions of products shall be in accordance with the standard terms and conditions of sale for such products, which are available upon request.

FISCHBEIN reserves the right to make changes and improvements to products without notice and without incurring any obligation to make such changes or add such improvements to products sold previously.

The use of repair parts other than those included within the FISCHBEIN approved parts list may create hazardous conditions over which FISCHBEIN has no control. Therefore FISCHBEIN cannot be held responsible for equipment in which non-approved repair parts are installed.

ATTENTION!!!!!!

OPERATORS AND MAINTAINING THIS EQUIPMENT SHOULD READ THIS ENTIRE DOCUMENT BEFORE ATTEMPTING TO HANDLE OR OPERATE THE MODEL F SERIES PORTABLE BAG CLOSER.

USE CLEAN, DRY NON LUBRICATED AIR – MOTOR NEEDS NO LUBRIFICATION.

2. MACHINE SPECIFICATIONS.

Model:	F-R-TA70
Stitch length:	approximately 7 mm
Maximum thickness of sewn material:	6,5 mm
Sewing speed:	approximately 13,6 m / min (charge)
Weight:	7,1 kg ,with electric cord and 200gr cone.
Vibration level:
Noise level:	79 dB.
Air supply:	air motor Min: 0,5Mpa- Max: 0,8 Mpa.
Seam:	single thread chain stitch.
Needle:	D5, REF: 13050
Thread:	20/4 Polyester, 200 gr cone

VIBRATIONS!!!!

Daily exposure values must not exceed 180 bag/h over a period of 8 h (1 work shift)
Bag width: 55cm Internal doc: A003-0237PD

3. GENERAL GUIDELINES FOR TORQUE APPLIED TO F HARDWARE.

Cover screws:	2,5 - 2,9 Nm
Needle bar guard and other covers:	2,5 - 2,9 Nm
Retaining collars (internal or external):	2,5 - 2,9 Nm
Looper holder and cam follower clamp screws:	2,5 - 2,9 Nm
All other set screws:	2,5 - 2,9 Nm
All other hardware fasteners not specified:	2,5 - 2,9 Nm
Needle bar clamp:	2,9 - 3,5 Nm
Looper Cam set screws:	not exceed 0,14Nm
Eccentric set screws:	2,9 - 3,5 Nm
Slide bar button head screws (4):	2,1 - 2,3 Nm

5. SERVICE.

Should your machine require factory service or maintenance, please contact any of the Fischbein authorized distributors or Fischbein Brussels. Return the warranty card with details concerning your problems for warranty justification.

They can also give you the best advice on utilization, oil, thread and spare parts.

6. RECOMMENDATIONS FOR MAX. PERFORMANCE .

6.1. Work area.

The MODEL F-R machine should be operated in an area that allows freedom of motion for the operator and the unit. The machine's input end at the feed dog works quickly and the output end near the thread knife is very sharp. Other operators should keep out of arm's reach from the area in which the machine works. Operators should always wear proper eye protection when operating the machine and not wear loose clothing or jewelry. Long hair should be pulled back and tied to avoid getting caught in the machine.

6.2. Before you start the machine.

1. Make sure your machine is well connected to an adequate power supply as indicated on the motor. Verify that all guards are in place.
2. No special installation is required, but we may recommend you to place something on the ground to set the machine on when not in use.
3. The machine is shipped to you with some examples of sewn test trips. Examine these carefully to see how proper chain form should look.
4. Use of the Fischbein model 1550PLUS suspension and balancing unit is recommended. This will allow the machine to be suspended at any convenient height, ready for use.
5. You may want to try the machine on some empty bags or pieces of paper to get a feel of how to use it, before you start with filled bags.

6.3. As you sew with the Fischbein model F-R-TA70 .

1. Do not use the machine in very humid or explosive environments.
2. Machine mechanism will carry the bag automatically through; therefore do not pull, push, or turn the machine.
3. Keep hands and fingers away from the bag moving mechanisms.(feed dog, presser foot)
4. Only use the machine to close bags of specific thickness. It is not designed for clothing or very thin plastic bags, (see page 3, machine specifications).
5. A minimum of paper bag strength is required. For plastic bags, a minimal thickness of 120 μ (microns) is necessary, depending on quality of PE used.

USE CLEAN, DRY NON LUBRICATED AIR – MOTOR NEEDS NO LUBRIFICATION.

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

6.4. Maintenance.

1. Always use genuine Fischbein parts.
2. Do not use screws other than those indicated in the parts list. Hardware items on the Fischbein model F systems are not metric.
3. Always use original Fischbein D5 needles.
4. Use a 20 / 4 Fischbein 100 % polyester thread to get the best results.
5. Fischbein Premium Thread (Ref: 25010) is an excellent product, and available in various colors. With a full 200 gr cone you will sew around 250 bags (depending of bag width ness).
6. We also recommend that you use other Fischbein products such as: cleaning agents and crepe paper (tape); these products were selected to avoid problems and allow maximum efficiency of the machine.
7. Proper settings for all internal components are made at the factory, any change to these settings could cause damage to the machine mechanism.

7. HOW TO USE THE FISCHBEIN PORTABLE BAG CLOSER?

1. Take the machine in your right hand and place your finger over the start switch placed on the underside of the handle.
2. The switch engages and disengages with a positive “click“. Pressing and holding it in will start the machine running, releasing it will stop the machine.
3. It is recommended that bag top “gussets“ be formed before sewing the bag. This will make a stronger and more durable closure. See fig: 1-3.
4. Take the top of the bag in your left hand at the right side of the bag.
5. Feed the top of the bag between the presser foot and the throat plate.
6. Press on the switch so that the machine starts running. During the closing operation, the bag will carried through the sewing gap correctly by the action of the feeding mechanism. There is no need to push the machine or pull the bag.
7. When the bag is in the machine, it may be useful to shift your left hand to the other end of the bag top to support the bag and achieve a straight seam.
8. When you reach the end of the bag, let the machine run for a little to form a short “chain“ and then gently turn the machine to the left, enabling the knives to cut the thread.

WARNING !!!!

Keep always your hand away from the presser foot to avoid the danger that your hand could be caught by the feed dog.

NOTE.

Important to check is the free space available between the top of the bagged product and the sewing line. The free space must be sufficient the whole width of the bag to allow enough material to sew.

When closing net bags or jute bags, a free space between the top of the product and the sewing line of 10 cm is recommended. For paper bags, not less than 5 cm is suitable.

Experiment with each type of product and bag material to see how much space needs to be left, to avoid tearing of the bag.

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

8. HOW TO HANDLE A BAG BEFORE CLOSING IT?

Fig 1: When the bag is filled in and ready to be closed, you must manually reform the bag top including the recommended gussets.

Fig 2: After reforming operation, fold the bag top as close as possible to the product and bring the bag in its original vertical position as shown on Fig : 2 and 3.

Fig 3: You can now start the closing operation remembering to leave sufficient free space between the top of the product and the sewing line.

Fig 4: When handling a jute bag with thick bag edges, do not introduce this edge directly into the mechanism but shift the edge gently before introduction and starting the closing operation.

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

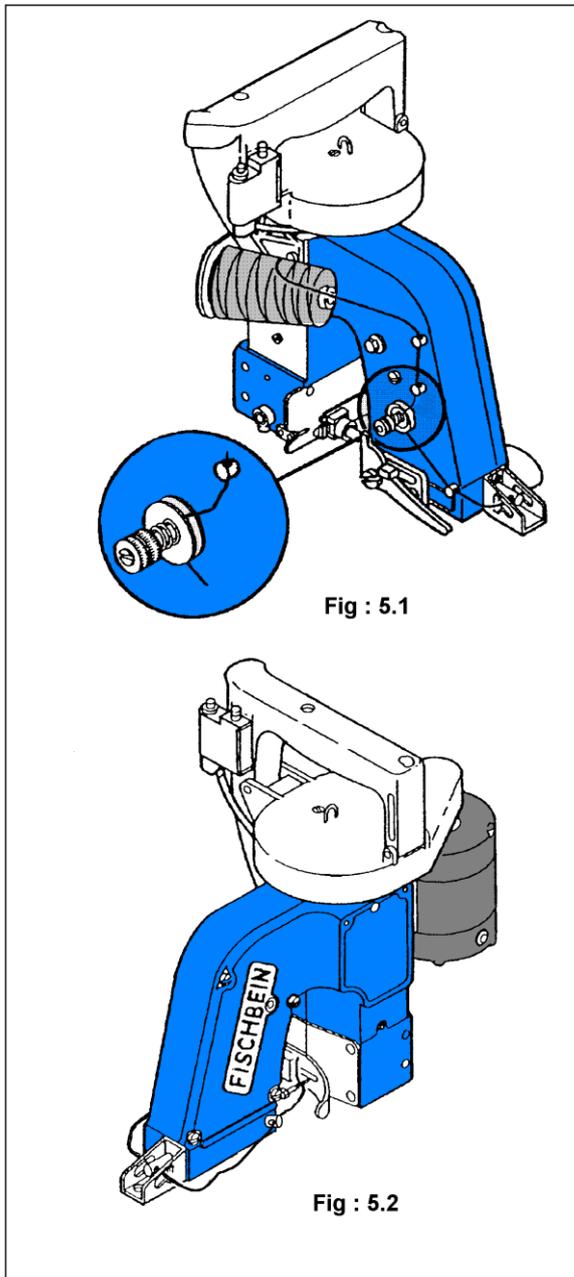

9. METHOD OF THREADING, ADJUSTMENT AND TENSION.

WARNING !!!

Always disconnect the machine from its power source before threading or adjustment .

9.1. Threading.

To thread the machine follow the thread path indicated in Fig:5.1 &5.2 .

1. Pass the thread through the first and second eyelet (11109).
2. Take the thread around the tension stud, inserting between the two tension discs (11114).
3. Pass it through the third eyelet (11109) close to the needle bar guarding (11101).
4. It should then be passed through the slotted opening in the needle bar guard, through the needle bar (11500) and finally through the opposite side of the needle bar guard.
5. Then push the thread through the eyelet (11109), to reach the needle front side.
6. Push the thread through the needle eye from the front side and pull it through for about 8 cm .
7. Take a bag or small test piece and introduce it between the throat plate and the presser foot, making sure that the needle is up. Start the machine and sew it through. This will provide a “thread chain “.
8. The machine is now ready to be used.

9.2. Thread cone replacement.

To install a new cone of thread:

1. Unscrew the wing nut (11805) at the base of the thread stand.
2. Remove the thread clamping bolt (11804).
3. Take a new cone of thread; place it on the thread clamping bolt, and put it on the thread stand (11815) .
4. Re - attaching the wing nut and tightening it sufficiently. The cone must not be able to rotate or wobble on the thread stand

9.3. Tension adjustment.

It should not typically be necessary to change the thread tension unless you change to a much different thread or are sewing a special type of material. Consult your dealer or a Fischbein service representative for questions concerning special thread applications.

The spring (11115) determines the tension on the thread when pulled through the two discs (11114). By turning the nuts of the tension discs clockwise, you will get more thread

tension, by turning in the opposite direction you will reduce that tension.

- The first nut (11117), close to the spring (11115) is there to adjust the tension, the second nut (11116) and the washer spring (11120), serve to lock the adjustment.
- The screw (SB64014) prevents eventual loss of the nuts (11116&11117) and has no adjustment purpose.
- Start with minimum tension initially and examine the stitch. If it appears too loose, gradually tighten the tensioning nut until a proper stitch is achieved. Be sure to tighten the locking nut when the proper setting is reached.

9.4. Crepe tape

Portables equipped with the crepe tape application have a tape folder mounted to the throat plate and the input side of the machine. (Fig: 9B) Check to see that the fasteners are tight and that the tape is properly threaded through the folder to the presser foot.

Fig: 9B

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

If the tape needs to be guided through the machine cut the end of the tape as shown in **Fig: 9C**. This allows the tape to pass through the folder more easily. The folder should fold the tape evenly over the bag top before it travels under the presser foot where it is sewn to the bag.

Fig: 9C

Create a thread chain after threading the tape through. A couple of test bags should be sewn and checked.

When feeding a bag top into the machine, it is important to keep it level with the machine's sew line. The bag top should also be as far up into the folder as possible to create a small "soft top". See Fig: 9E The folded edge of the tape should be within 1/16 inch (1,6 mm) from the bag's top edge for a good seal.

- A: Folder
- B: Free space between folder and bag.
- C: Bag.

9.5. With Crepe paper applicator

The tape and thread knife assembly attached on the output side of the machine is designed to cut the thread and the tape manually. This is accomplished by pulling the handle of the knife so that it rotates. (**Fig: 9G**) The leading edge of the bag will have a tab length (**Fig: 9F**) of about 2 inches (51mm). The tab length on the bag's trailing edge is determined by the operator.

- A: Crepe Paper
- B: Tab Length
- C: Bag

Follow the same procedures as you would for handling and sewing the bag as mentioned in the plain sewing section, except for the last step of cutting the thread.

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

Once the trailing edge of the bag has passed the presser foot, the operator should continue sewing, until the desired tab length is reached. (Fig 9F) After the machine is stopped, the operator lifts the knife handle, which cuts the tape and thread. (Fig 9G) It takes a little practice to establish the tab length on the trailing edge of the bag.

- A: Moving Knife
- B: Stationary Knife
- C: Handle

Fig: 9G

10.HOW TO OPEN A SEWN BAG?

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

11.MAINTENANCE AND SMALL REPAIRS.

WARNING !!!!

Always unplug the machine before starting maintenance or repair.

11.1. DAILY MAINTENANCE.

11.1.1. Lubricating the machine in operation.

1. Before closing your first bag, be certain to see that the lubrication mechanism is functioning properly.
2. To speed oil through the machine mechanism you must simply press the oil pump button 2 or 3 times in succession. You will see the oil flowing through the feeder tube as you do. This should be performed every 2 hours of machine usage. The wicking inside the housing carries the dispensed oil to other moving parts near the looper and needle bar. Do not remove the wicking from the MODEL F-R-ATEX. If the wicking (11508) becomes worn and thin, replace it immediately.
3. Check the level of the oil pump regularly. Always fill with genuine Fischbein machine oil (12800).
4. Always replace the oil reservoir cap to avoid contaminating the lubricant. This could cause the oil lines to plug and prevent lubrication of the machine parts.
5. We recommend pushing the oil pump while the machine is running to give better oil distribution inside the machine.

11.1.2. Cleaning of the machine.

Each day, clean the machine of any dust or accumulated debris. This can easily be done by blowing out the machine cavities with compressed air or by using a dry bristle brush. Sticking particles must be removed by using a small brush.

Do not forget to clean around the bottom of the machine, especially around the looper and the knives.

If you are working in a very dusty environment, we recommend this cleaning operation twice a day. To do that, simply slide open the looper cover (11102). Blow out the inside with compressed air. Close the looper cover and tighten the cover pivot screw (11108) if necessary.

By doing these operations daily, you will increase the life of your machine.

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

11.2. WEEKLY MAINTENANCE.

WARNING!!!!

Always disconnect the machine from the electrical power source before performing any maintenance or adjustment.

Clean the machine weekly, for a few minutes in a cleaning oil bath.
How to proceed?

1. Fill in a small tank with cleaning oil up to 6 cm maximum.
2. Remove looper cover located at the bottom of the machine and the belt pulley cover and handle.
3. Plunge the machine vertically into the oil so that it is immersed to the level of the throat plate.
4. Turn the machine manually at the pulley so the moving parts are cleaned in the cleaning oil bath.
5. Remove the machine from the bath and drain any excess of oil from the mechanism.
6. Your machine is now free of dirt and parts are cleaned up.
7. If necessary you may want to loosen any stubborn dirt or grit with a small brush and rinse the machine again.
8. Afterwards you may want to clean the outside parts by using a small oiled brush. Wipe the machine off with a soft, absorbent cloth.

CAUTION !!!!

For a good job, always use Fischbein cleaning oil (12802).

Never use benzene or similar aggressive or volatile products. Such products could dry the oil from critical moving parts and cause extensive damage to the machine or melt some of the plastic components.
Volatile solvent fumes could present a fire hazard if the machine is run where such vapors exist.

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

12. BOTTOM SIDE VIEW OF THE F PORTABLE BAG CLOSER.

After removing needle bar guard (11101), looper cover (11102) and knife guard (11125).

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

13. REPLACEMENT OF PARTS: HOW TO PROCEED?

13.1. Placement of the machine for parts replacement.

Place the machine so that it rests on the motor and the machine handle is flat against the table. It should be sitting so that you are looking into the looper cavity and at the needle bar guard.

Fig : 4

13.2. How to replace a needle?

The needle is held in the needle bar by using the special nut (11501).

The nut should be adjusted with a 3/8 open end wrench or suitable adjustable tool (11645). Be careful not to strip the threads or the hex surface. **Do not use pliers.**

1. Unplug the machine.
2. Remove the pulley guard (11801).
3. Raise the presser foot to its detent position and rotate the machine manually until the needle bar is at its highest position.
4. Loosen the needle bar clamping screw (11501) with the wrench provided with the machine (11645).
5. Remove the needle. (D5)
6. Place the new needle in the needle bar making sure that it is fully inserted and that the long groove faces you and the needle scarf is to the back. The groove lips should match the base of the machine as close as possible and the eye should be facing you.
7. Tighten the screw to clamp the needle in place. The nut is designed so that it does not require excessive force to tighten, a firm torque will be sufficient.
8. Lower the presser foot.
9. Check to see if the needle is parallel with the throat plate (11210) See also

Fig : 5

Fig:5A

Fig: 5A.

10. Replace the pulley guard.
11. Re - thread the machine.
12. Use always genuine Fischbein D5 needles.

CAUTION !!!

Keep always your fingers away from under the needle.

50007F

FISCHBEIN LLC

The Leader in Bag Closing Technology

13.3. How to replace the looper, 11300.

1. Unplug the machine.
2. Place the machine in the position described above.
3. Raise the presser foot to its detent position. See Fig: 6.
4. Remove the pulley guard (11801) and rotate the machine manually until the feed dog is at its lowest position.
5. It's advisable to remove the needle (D5) for safety purposes.
6. Remove the looper cover (11102) by unscrewing screw (11108).

Fig : 7

Fig : 6

7. Remove the throat plate (11210) by unscrewing the 3 screws (F64038).
8. Remove the feed dog (11203) by removing screw (SC8321) and the washer (WS8).
9. Remove the looper (11300) from the looper holder (11301) by loosening the set screw (SS832316HD).
10. Install the new looper (11300) into the looper holder (11301). Make sure that: the flat side of the looper is faces the set screw (SS832316HD) The looper is inserted completely to the bottom of the looper holder (11301). This is very important for the adjustment of the machine.
11. Tighten the looper set screw (SS832316HD).
12. Replace the needle as per the previous procedure.
13. Now is a good time to check the machine timing (see timing procedure).
14. Replace the feed dog making sure that it is set correctly on the height adjustment screws.
15. Replace the throat plate.
16. Replace the looper cover and check to see that all screws are tight.
17. Replace the pulley guard.

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

13.4. HOW TO REPLACE THE FEED DOG 11203?

1. Unplug the machine.
2. Place the machine in position described at the beginning of this chapter.
3. Get the presser foot up by getting the lever lifter presser foot (11654) down.
4. Remove the throat plate (11210).
5. Remove the looper cover (11102).
6. Remove the pulley guard (11801) and turn the machine until the needle reaches the highest point.
7. Unscrew both (SC8321) screw and (WS8) washer from carrier block (11437) to get feed dog (11203) out.
8. Set up a new (11203) feed dog on and set (SC8321+WS8) back again by secured screwing.
9. Reassemble other parts back.
10. Your machine is ready again for new jobs.

13.5. HOW TO REPLACE THE KNIVES?

The thread and tape knife assembly consists of the stationary and moving knife. If they become dull and need to be replaced, take the following steps: See Fig: 9A.

1. Unplug the machine and place it on a work surface.
2. Remove the three screws (A) and remove the knife assembly from the machine.
3. Remove the spring and screw (B).
4. Remove the spring post (C) and the two screws (D).
5. Remove the stationary blade.
6. To change the moving blade remove the two rivets (F).
7. Replace the moving knife (1604) on the handle and attach with two rivets (F).
8. Assemble the stationary blade in place using screws (C) and (D).
9. Apply a thin layer of lubricant to the blades.
10. Assemble the moving knife to the stationary assembly using screw (B).
11. Replace the post (C) and reattach the spring (E).
12. Assemble the tape-thread knife assembly to the machine using the three screws (A).

13.6. SCREWS AND HARDWARE.

All fasteners and hardware are assembled to Fischbein factory torque specifications, but because of the vibration inherent in any machine operation we recommend that periodic inspection and adjustment of the following hardware items be performed to ward off potential damage to the machine.

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

To proceed:

1. Unplug the machine.
2. Remove the needle guard (11101) and the looper cover (11102).
3. Check the set screws on the needle bar clamp (40502), and tighten if necessary.
4. Check the set screw on the presser foot lifter (11652), and tighten if necessary.
5. Replace the needle guard (11101).
6. Remove the looper cover (11102).
7. Check the set screw and the clamp screw on the looper holder (11301), and tighten if necessary.
8. Check the socket cap screw holding the presser feet dog (11203) and tighten if necessary.
9. Check the hex head screw on the knife bracket (11007), and tighten if necessary.
10. Replace the looper cover (11102).
11. Remove the housing cover.
12. Check the set screws on the cam assembly (40310), and tighten if necessary.
13. Check the set screws on the connecting rod assembly (11079), and tighten if necessary.

WARNING!!!

Never remove these screws or change the orientation of either of these components. Never try to remove a broken screw or attempt to drill it out. Consult your repair center.

Note:

If this assembly moves the machine must be re - timed, tighten it if necessary.

14. Check the clamp screw on the cam follower assembly (40317).
15. Check the hex head screw attaching the connecting rod assembly (11079) to the needle arm assembly (40099), tighten it if necessary.
16. Replace the housing cover.
17. Finish by checking the throat plate screws and checking and adjusting the belt tension.
18. Reassemble the machine and it is ready to sew.

13.7. REPLACING THE BELT.

1. Unplug the machine.
2. Remove the thread cone from the thread cone holder (11815).
3. Remove the handle assembly by unscrewing two screws (SC142034)
4. Loosen the two set screws (11908) on the hinged motor mount 11906

5. Press the motor mount completely closed to allow slack for removal of the used belt and to allow the new belt to be installed.
6. Install a new belt (11340) around both pulleys.
7. Apply tension to the belt by opening the motor mount hinge and tightening the two set screws. The belt must remain slightly flexible.
8. Reattach the handle assembly, and the thread cone holder + thread cone back on the machine.
9. Your machine is now ready to use.

14.MACHINE ADJUSTMENTS.

In order for your machine to perform to its fullest capabilities it is important to maintain the machine timing and to be sure that the key components in the sewing operation are in good repair.

Basic components important to the sewing operation are the:

- ⇒ Needle - it should be sharp and correctly oriented.
- ⇒ Feed Dog - the teeth should be sharp and the height should be correct.
- ⇒ Loper - it should be smooth and correctly adjusted.
- ⇒ Before any adjustment to the machine, it is important that you respect following basic rules.

1. Unplug the machine.
2. Always rotate the pulley in the direction of machine operation.
3. Install a new needle.
4. Adjust the machine in a 3-step procedure, followed by a running test.
5. It is important to follow these steps in order.

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

14.1. LOOPER STROKE ADJUSTMENTS.

1. Put the machine on a flat surface, with the looper cover (11102) facing you.
2. The needle bar guard will be pointing up and the motor will be underneath, Fig: 4.
3. Raise the presser foot (11400) with the lifting lever (11654) until the presser foot is no longer touching the throat plate (11210), see Fig: 6.
4. Remove the looper cover (11102).
5. Remove the pulley guard (11801).
6. Remove the throat plate (11210), Fig: 7.
7. Remove the feed dog (11203), Fig: 3.
8. Turn the machine pulley (11339) until the looper (11300) is at maximum back stroke position to left of needle.
9. At this moment, the distance between the point of the looper and the left side of the needle must be of 0,8 mm. Use gage, 11302, to check that distance, Fig: 9.
10. If that distance is not correct, take off the housing cover (11299) and 6 screws (SC83212).
11. Loosen screws (SC63258) of the arm, follower cam (40317) and turn the looper shaft (11303) up to reaching the distance of 0,8 mm Tighten the screw SC63258.

Fig : 10

14.2. ADJUSTMENT OF THE NEEDLE HEIGHT VERSUS THE LOOPER.

1. Always adjust the needle height after the looper stroke adjustment has been made. See previous procedure.
2. Remove the needle bar guard (11101).
3. Turn the machine pulley (11339) in the direction of machine operation until the looper begins to come forward, toward the needle.
4. As the looper passes behind the needle the point of the looper should be visible past the right edge of the needle (0,8 mm max .) just before the bottom edge of the looper hook is seen in the eye of the needle, see Fig.

If adjustment is necessary.

1. Slightly loosen the screws (SC54012) on the needle bar clamp assembly (40502).
2. Move the needle bar (11500) up or down until you reach an adjustment as per step 3.
3. Be sure that you do not rotate the needle bar or the machine pulley as you are performing this step.
4. When the proper setting is reached, tighten the screws (SC54012).
5. Rotate the machine trough one cycle to verify your adjustment.

Fig : 11

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

NOTE!!

As you rotate the machine for timing purposes, always move forward. If you pass the setting point, simply turn the machine trough the cycle, back to the point you require.

14.3. LOOPER CLEARANCE ADJUSTMENT.

To verify this adjustment, you have to look at the machine from the side. The aim of this adjustment is that the point of the looper passes behind the needle, as close to the “needle scarf” as possible, without touching it. The needle scarf is the hollowed-out section of the needle on the un-grooved side just above the hole, see Fig: 11.

If an adjustment is necessary, please proceed as follows:

1. Rotate the machine until the looper is directly behind the needle. Do not forget; always rotate the pulley of the machine as the arrow indicates.
2. Loosen the socket cap screw (SC54038) on the looper holder.
3. Move the looper holder (11301) on the looper shaft (11303) until the looper is positioned as closely as possible to the needle without actually touching it. You should be able to pass a sheet of paper between the back of the needle and the looper edge.
4. When this is complete, tighten the socket cap screw on the looper holder.
5. Rotate the machine trough a complete cycle to be sure that the looper clears the needle both on the up stroke and the back stroke of the cycle. When you have made or verified all of the adjustments, you can replace the guards, covers, and parts removed when you began.
6. Replace the needle bar guard (11101).
7. Replace the feed dog (11203) on the feed dog carrier block (11437).
8. Replace the throat plate (11210).
9. Replace the looper cover (11102).
10. Rotate the lifter lever back to its initial position. This will replace the presser foot on the throat plate.
11. Cycle the machine until the feed dog is at the top of its stroke to verify the feed dog height. This should be the feed dog should be 0,25 mm higher than the leading edge. This adjustment is made at the factory and should not need changing, even when replacing the feed dog.
12. Your bag closer is now ready to use!!!

approximately 2,4 mm . The trailing edge of the feed dog should be 0,25 mm higher than the leading edge. This adjustment is made at the factory and should not need changing, even when replacing the feed dog.

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

14.4. MOTOR INSTRUCTIONS.

The motors used on Fischbein bag closers are not designed for long-run periods without stops.

They are produced specially for numerous starts and stops as is the case for bag closing operations.

Little maintenance will be required but periodic inspection of the motor of the motor will assure that your machine continues to operate at maximum efficiency. The motor must not be oiled.

USE CLEAN, DRY NON LUBRICATED AIR – MOTOR NEEDS NO LUBRIFICATION.

14.5. TAPE FOLDER ASSEMBLY.

If the tape folder has to be replaced, follow these steps:

1. Unplug the machine from the power supply and place on a workbench.
2. Remove the reel of tape (**Fig: 9B**) and lift the presser foot using the lifter lever (11654) (**Fig:3, page 15**).
3. Loosen the two screws holding the folder to the throat plate (**A**) and remove the folder. (**Fig: 9B**)
4. Hold the new folder in place and attach it to the throat plate with the screws (**A**).
5. Replace the reel of tape and cut the end of the tape to a point. This makes feeding the tape through the folder easier.
6. Feed the tape through the folder until the tape is folded and under the presser foot.
7. Lower the presser foot and create a thread chain by manually rotating the machine pulley through a couple of cycles.
8. Run a couple of test bags and check the stitch and tape folding quality.

Fig: 9B

Fig: 9C

50007F

FISCHBEIN LLC
The Leader in Bag Closing Technology

A

As seen in **Fig 9D**, this represents a properly sewn bag with the crepe tape application. The bag top is close to the folded portion of the tape. Notice the tape and sew line are parallel to the top edge of the bag.

B

This closure **Fig 9D** is the result of the bag not being fed straight into the tape folder. The bag top should be level with the tape folder and sew line.

C

The last closure seen in **Fig 9D** is caused by not feeding the bag top high enough into the tape folder. The distance between the folded tape edge and the bag's top edge should be about 1/16 inch (1,6 mm).

15.TROUBLE - SHOOTING LIST.

1. Stitch is too loose.	1. Recheck thread tension. 2. Adjust thread between the tension discs, 11114.
2. Stitch is too short.	1. Eventually replace feed dog, 11203.
3. The bag is tearing up at the sewing line.	1. Do not hold the machine during the sewing operation of the bag. 2. Is there still good transportation of the bag? 3. Is there enough pressure on the presser foot, 11400? 4. Has the bag quality been changed?
4. Machine is no longer running!	1. Is the plug secure in position? 2. Is the power air tube still, ok? 3. Pull on switch, air must flow or else change switch
5. Thread breakage.	1. Is thread unrolling properly? 2. Check threads tension. 3. Is thread blocking thread guides? 4. The needle is too hot! 5. Use oiled thread. (pay attention to oil quality) 6. Call your Fischbein specialist.

22.SAFELY DISPOSING OF A MODEL F-R-TA70.

If a MODEL F-R-TA70 sewing machine becomes damaged beyond repair or simply worn to a nonfunctional state after years of service, it should be put out of service only after it is safe to dispose of it.

First, drain all the oil according to your appropriate local environmental regulations. After the oil is be drained and disposed of, bring the sewing head to a recycling center or metal scrap facility.
